

The Enterprise Label Management Software Checklist

Nine questions to put to every vendor before you buy — on data separation, scale, audit readiness, and total cost of ownership. Bring this into your next vendor call.

Kallik

Label & artwork management software for regulated industries.

9 QUESTIONS TO ASK BEFORE YOU BUY

- 1 Does it separate your data from your artwork design?**
If regulated content and creative layout live in the same file, every language and market variant becomes a manual rebuild.
- 2 Can it scale across markets, languages, and regions without re-platforming?**
Ask what happens at 10x your current label count — not what happens today.
- 3 Does it generate a complete, audit-ready trail of every label change?**
You should be able to show who changed what, when, and why for any label, in any market, on demand.
- 4 Can it remove email from your approval workflow entirely?**
If "final_v3_APPROVED_reallyfinal.pdf" sounds familiar, this is the question that matters most.
- 5 Does it integrate with your existing PLM, ERP, and DAM systems?**
A platform that can't connect to the systems you already run just adds a new silo.
- 6 Can it absorb new regulatory requirements without a rebuild?**
Hazard classification changes, QR-code data carriers, and Digital Product Passport fields are all coming due — ask how it handles the next one.
- 7 What does implementation actually look like, and how long does it take?**
Get a real timeline with milestones for a company your size, not a general sales estimate.
- 8 Can non-technical users make approved changes without IT or an agency?**
Every round-trip to IT or an outside agency adds a day to your time-to-market.
- 9 What's the total cost of ownership once you count the price of errors?**
Licensing is one line item. Mislabeling, recalls, and agency rework are the ones that actually move the budget.

See Veraciti™ answer every question on this list.
